Find the terms. Keep the final say.

A shared negotiation workspace for Customer, Provider, and Finance. Agents explore supported terms. People decide what becomes an agreement.

THE PRODUCT PROMISE

Private constraints.
Visible trade-offs.
Exact approvals.

No external payment or binding signature is sent.

01

Brief

Confirm constraints and choose disclosures.

02

Negotiate

Agents work from confirmed catalog sources.

03

Decide

Review the exact proposal and versions.

04

Record

Final approval records one internal outcome.

Canonical release: DevEngers27/speak-for-me main baseline + PR 101 + release improvements. Delivery branch: final_product.

DESIGN & ARCHITECTURE

Three agents. One controlled decision.

Google sign-in runs through Clerk. Convex verifies sessions and projects each role's data.

Customer

Required scope, preferred items and delivery deadline.

Provider

Confirmed catalog prices, lead times and delivery tasks.

Finance

Budget cap, existing commitments and final spending authority.

Google via Clerk
Google sign-in + Clerk session

>

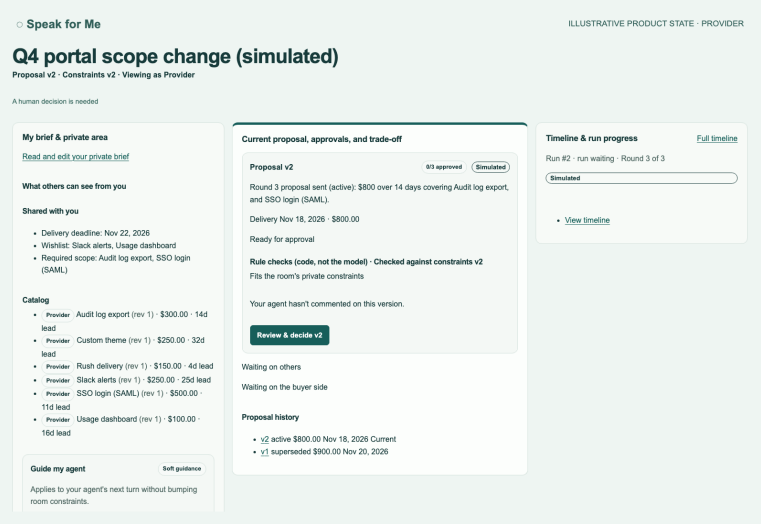

Convex state
Verified identity + permissioned access

>

Bounded agents
Role-scoped Claude proposals

>

Deterministic rules
Source checks, approvals, atomic records

Illustrative React fixture render; not a connected browser capture.

PROVIDER VIEW

A fit signal, never Finance's private budget.

Provider cannot receive the cap, committed balance, headroom, or private budget-derived checks. Customer sees explicitly disclosed fields. Private notes and agent rationale stay with their principal.

Every human approval binds immutable terms, a constraints version, and a member. A stale vote cannot authorize new terms.

OBSERVED LIVE RECOVERY

A budget cut changes the agreement.

Real Claude calls on the isolated Convex deployment; synthetic seed identities via admin impersonation.

1

$900 proposal

SSO login $500 + audit export $300 + optional dashboard $100. Customer and Provider approved; Finance had not.

2

$5,000 → $4,800 cap

Finance reduced the cap with $4,000 already committed. Constraints became v2; two earlier approvals no longer applied.

3

Human choice required

The live run reached rounds_exhausted / needs_input. Autonomous completion stopped. Customer explicitly selected option A, reusing the existing live-model $800 essentials proposal.

4

$800 recorded outcome

Three fresh approvals. The final required vote recorded one execution, one ledger commitment, one change order and two tasks.

MEASURED LIVE WINDOW

7

real model calls

$0.086849

Estimated model cost

p50 4.106 s / p95 4.448 s

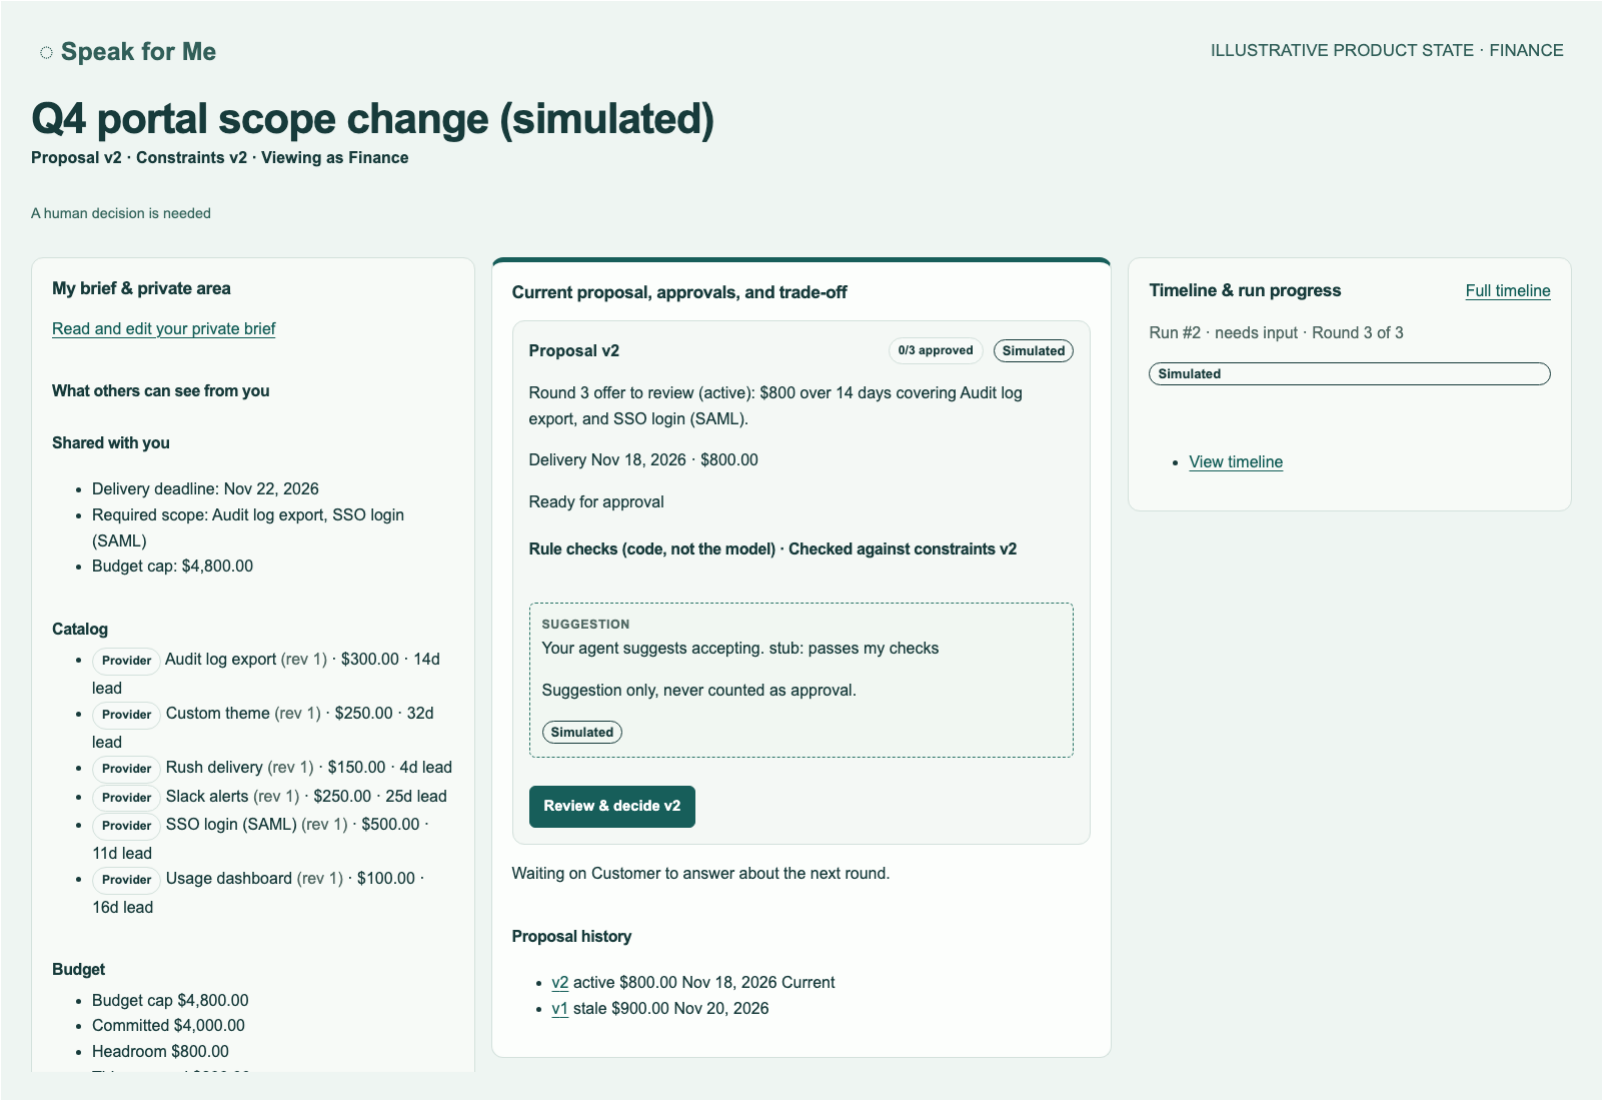

Deployment-wide window, n = 7. Cost uses the 2026-10-06 price table and is an estimate, not an invoice. This tiny sample is not a performance benchmark.

Separate $4,700 check: Finance chose end_run; no model turn, execution, commitment or tasks; budget unchanged and zero invariant findings.

Observed final-approval overlap returned one outcome; the probe reported zero invariant findings and passed projected privacy checks.

Evidence: 2026-10-25-release-live-smoke.json and 2026-10-25-release-human-recovery.json. The autonomous smoke remains pass:false; the explicit human recovery is pass:true.

A shared workspace with private boundaries.

CURRENT TERMS

Proposal and constraint versions stay visible beside the required decision.

PRIVATE CONTEXT

Your own brief and shared facts remain separate from the common proposal.

PROGRESS

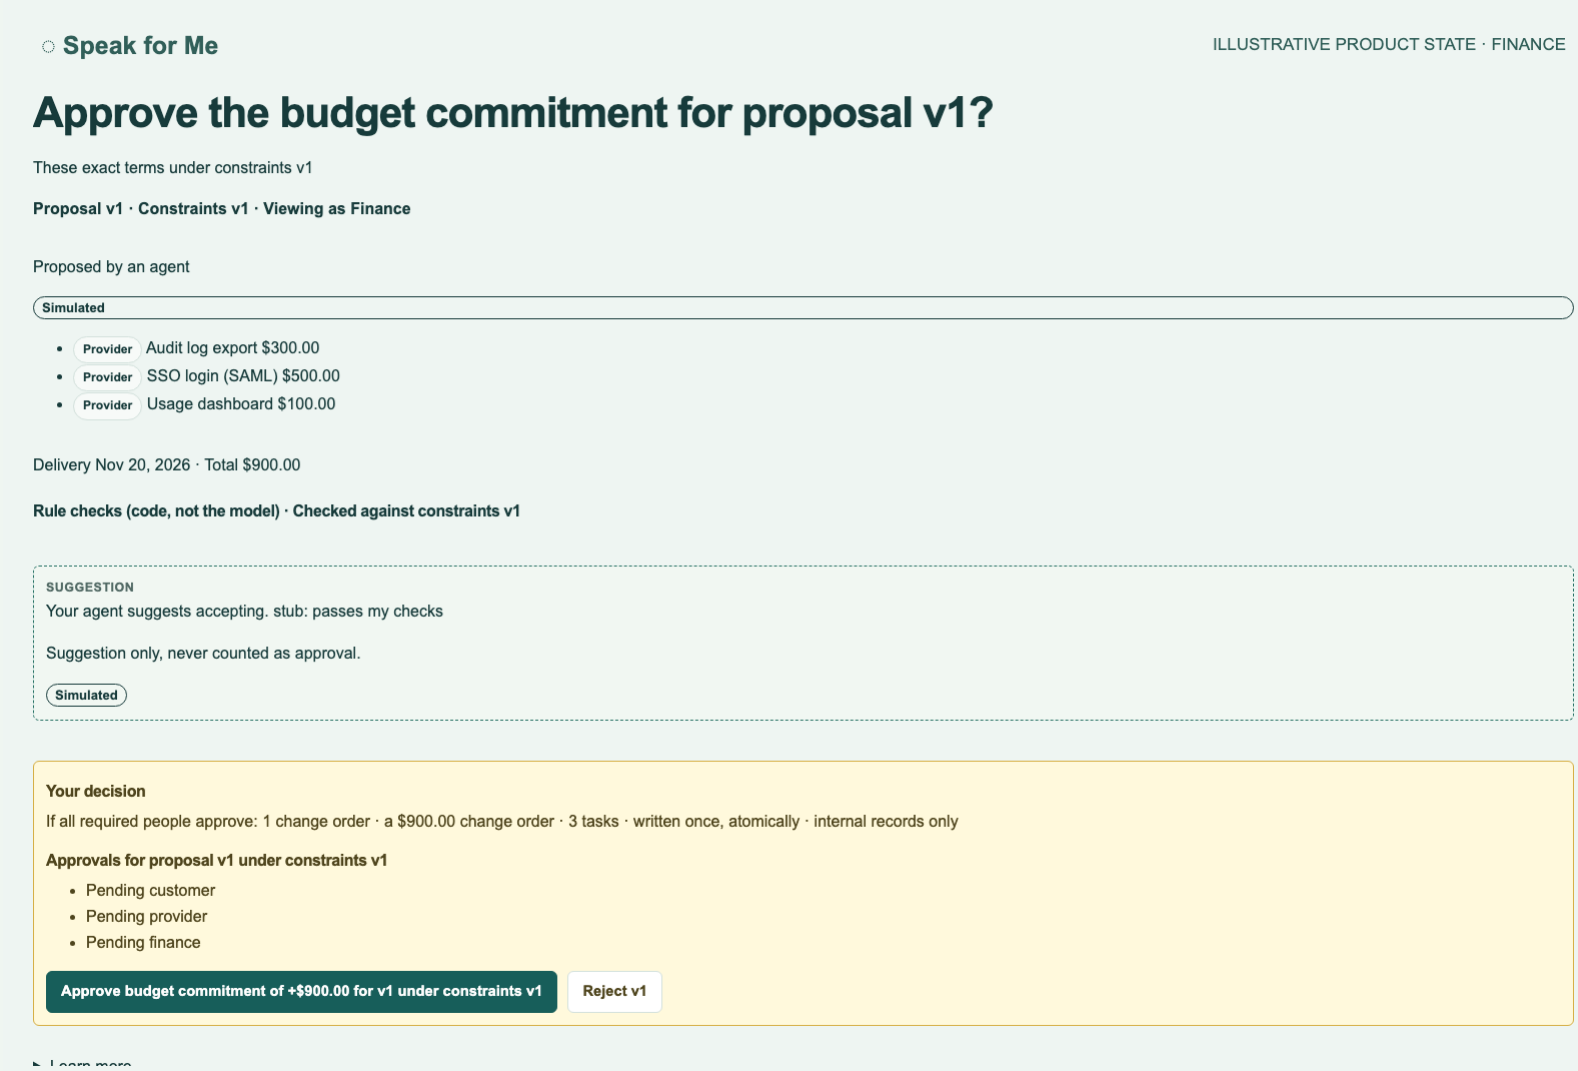

Run state, waiting, history, and recovery links explain what happens next.

READABLE DETAILS

Item titles come only from the viewer's projected catalog.

ILLUSTRATIVE VIEWPORT EXCERPT: current React workbench rendered with a canonical Finance fixture. These fixture images do not establish browser login or live synchronization.

Consent means these exact terms.

HUMAN AUTHORITY

Agent suggestions are separate from rule checks and approvals.

VERSION BINDING

Changed constraints invalidate earlier authority. People review and approve again.

EDITORS COMPLETED

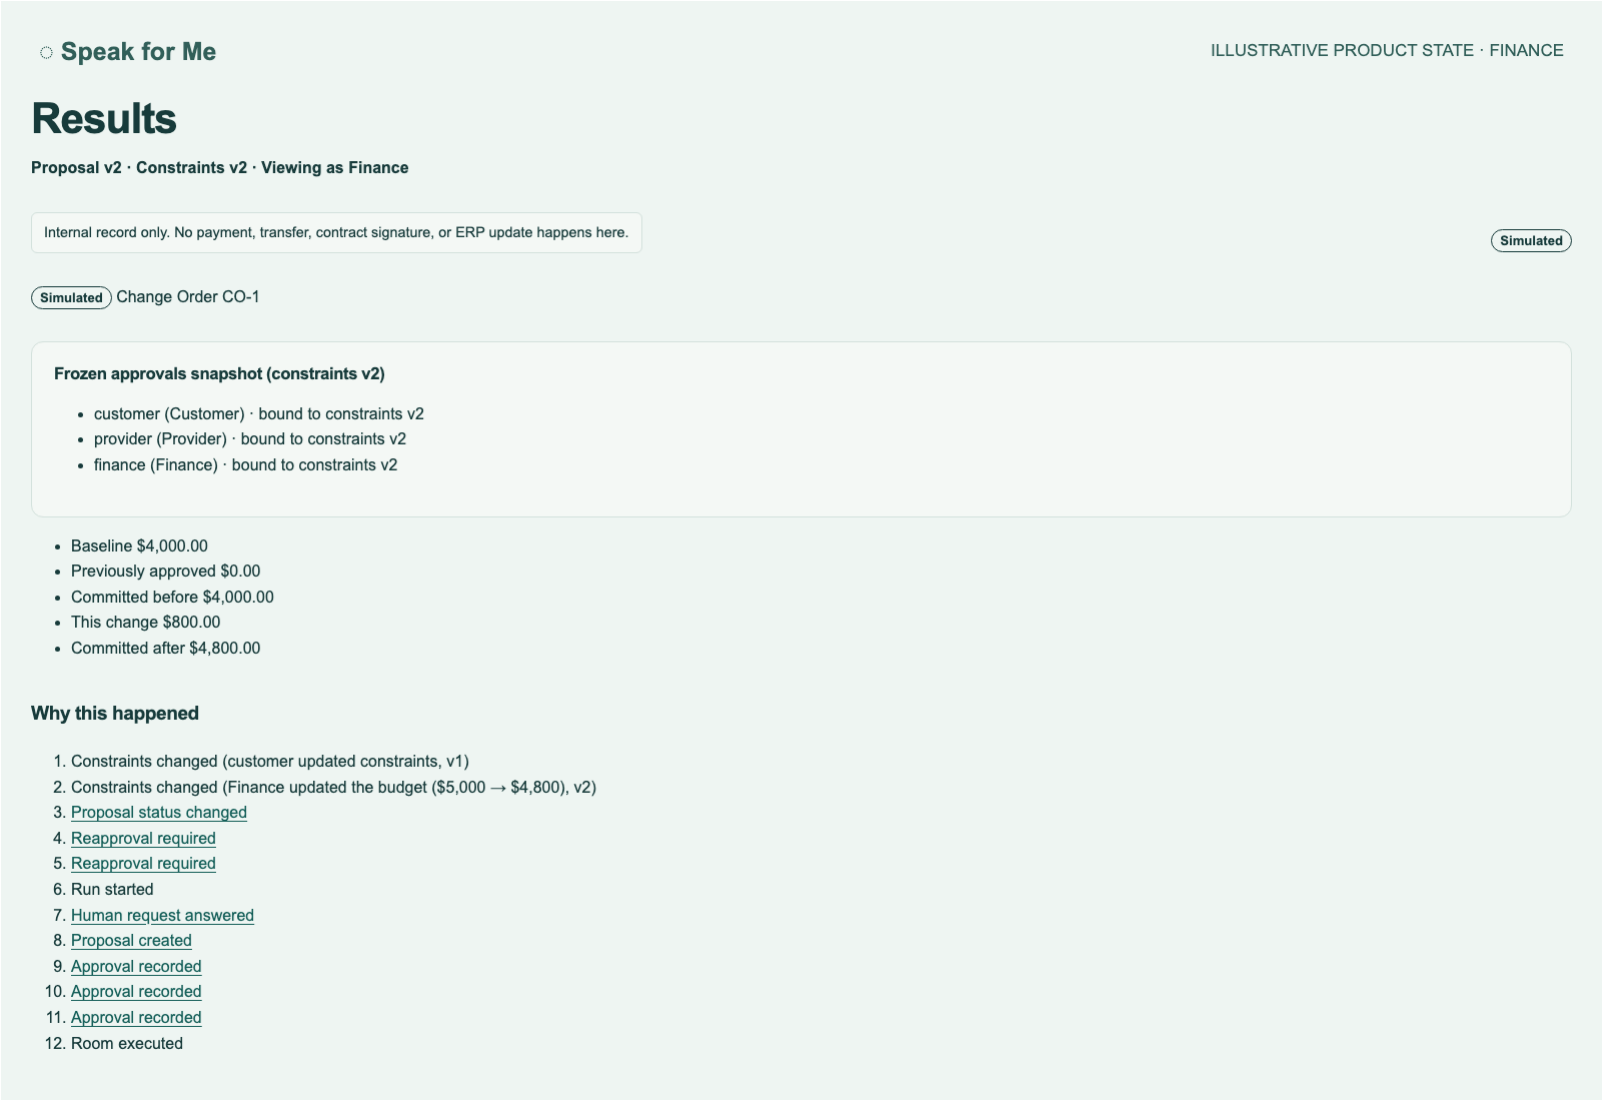

Required scope and wishlist selectors; private notes; catalog task templates; disclosure recipients and withdrawal.

SAVE SAFEGUARDS

Pending locks, draft warnings and reconnect status.

ILLUSTRATIVE VIEWPORT EXCERPT: canonical fixture rendered by the actual proposal screen. An offered candidate creates/selects a proposal; it does not count as approval.

Final approval records the agreement.

ILLUSTRATIVE PRODUCT STATE · FINANCE

Results

Proposal v2 · Constraints v2 · Viewing as Finance

Internal record only. No payment, transfer, contract signature, or ERP update happens here.

Simulated

Simulated Change Order CO-1

Frozen approvals snapshot (constraints v2)

- customer (Customer) · bound to constraints v2
- provider (Provider) · bound to constraints v2
- finance (Finance) · bound to constraints v2

- Baseline $4,000.00
- Previously approved $0.00
- Committed before $4,000.00
- This change $800.00
- Committed after $4,800.00

Why this happened

1. Constraints changed (customer updated constraints, v1)
2. Constraints changed (Finance updated the budget ($5,000 → $4,800), v2)
3. Proposal status changed
4. Reapproval required
5. Reapproval required
6. Run started
7. Human request answered
8. Proposal created
9. Approval recorded
10. Approval recorded
11. Approval recorded
12. Room executed

ILLUSTRATIVE PRODUCT STATE: rendered Results fixture. Fixture dates/text can differ from the real probe. The live recovery evidence, rather than this image, establishes the observed result.

ONE OUTCOME

The last required approval atomically records the internal change order, commitment and tasks.

OBSERVED RECOVERY

Audit log export and SAML SSO. Two Provider tasks, due November 8 in the live recovery probe.

FOLLOW-UP

A separate setup room was created once. Its $4,800 baseline suggestion still required Finance confirmation.

NO MONEY MOVES

Internal records only.

What is established. What remains open.

Evidence types stay separate: implementation, test fixtures, deployed probes, and real browser authentication.

ESTABLISHED	**Connected model + backend**	Seven real Claude calls, budget-cut invalidation and explicit human recovery to $800. Final approvals recorded one execution, commitment, change order and two tasks. These probes used synthetic admin identities, not browser login.
LIVE IDENTITY	**Google sign-in via Clerk**	The public site uses Google sign-in through Clerk, with Convex enforcing room membership and role permissions. One real account opened the inbox, created a Provider room, and saved private notes that remained after reload as confirmed brief v1.
RELEASE CHECKS	**Engineering evidence**	Released CI on commit 97c1417 passed 2,154 tests with 39 TODO cases retained. Lint, typechecks, builds and artifact checks passed. The authenticated browser workflow was skipped; these engineering checks do not prove a three-member browser journey.
ILLUSTRATIVE	**Screenshots + finished video**	The 177.0-second, 1080p/30 fps H.264/AAC film is complete; decode, subtitle timings and visuals were reviewed. Its Google identity label refers to Google sign-in via Clerk. React fixture renders are not authenticated browser footage.
OPEN	**Public site + final acceptance**	The entry site is public; rooms remain authenticated and membership-protected. Three-account acceptance, live synchronization and task completion remain unverified. Eligibility and Devpost submission status require separate confirmation; no submission is established by this report.
